Flatcar Container Linux

Flatcar Container Linux is a community driven and fully open source, minimal-footprint, secure by default and always up-to-date Linux distribution for running containers at scale.

- Minimal footprint, image-based, immutable Linux with A/B updates.
- Self-updating, supports automated rollbacks.
- Fully automated, declarative configuration applied during provisioning (early on first boot, from initrd): systemd units, files, SSH keys, users, groups, disk layout, etc.
  No interactive configuration required.
- Vendor neutral and community driven. Optimised for public and private clouds, bare metal, both large and small scale.
